

DATA ANALYST

Internship Task 3

DESCRIPTION

The task focuses on using MySQL to store and analyze sales data. It involves creating a database, importing a CSV dataset, and writing SQL queries to perform data analysis using aggregate functions, grouping, and sorting to extract meaningful business insights.

PREPARED BY

Reema Safrin M
(19-01-2026)

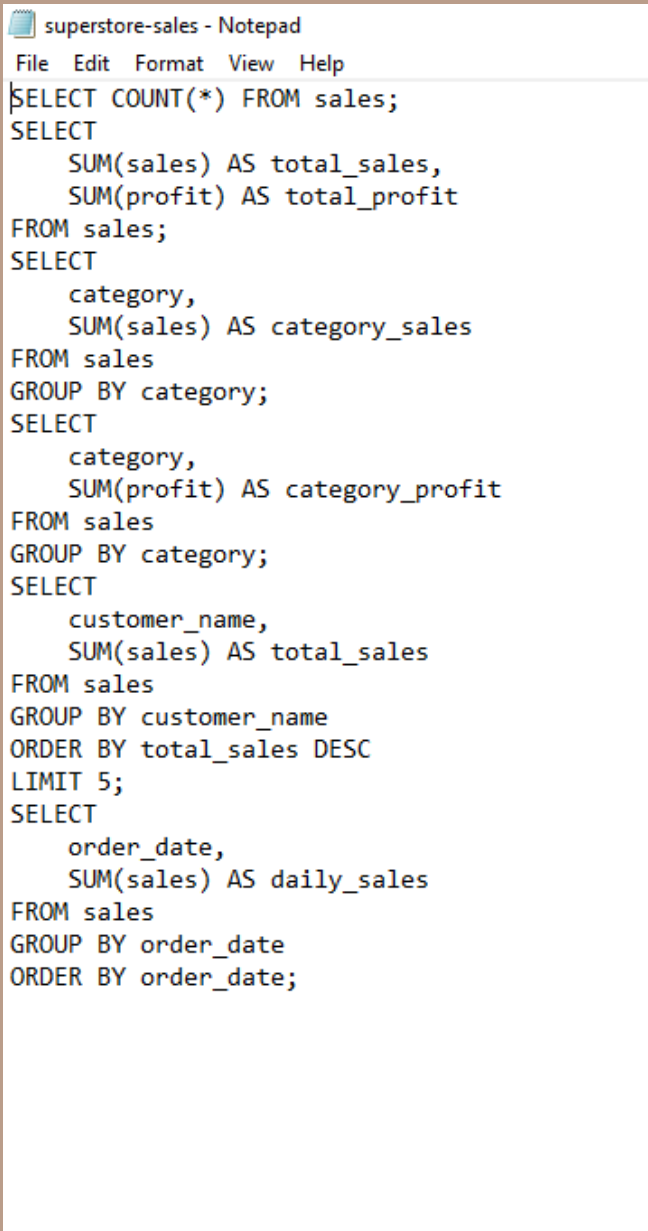

MY WORK

As part of this task, I created a database in MySQL and designed a table to store sales data. I imported a clean CSV dataset containing 100 records using MySQL Workbench. After verifying successful data import, I executed multiple SQL queries to analyze the dataset. These queries included calculating total sales and profit, analyzing sales by product category, identifying top customers based on sales, and observing daily sales trends. Screenshots of queries and results were captured for documentation. This task helped me gain practical experience in database creation, data import, and applying SQL queries for real-world data analysis.

OUTLINE :

```
superstore-sales - Notepad
File Edit Format View Help
SELECT COUNT(*) FROM sales;
SELECT
    SUM(sales) AS total_sales,
    SUM(profit) AS total_profit
FROM sales;
SELECT
    category,
    SUM(sales) AS category_sales
FROM sales
GROUP BY category;
SELECT
    category,
    SUM(profit) AS category_profit
FROM sales
GROUP BY category;
SELECT
    customer_name,
    SUM(sales) AS total_sales
FROM sales
GROUP BY customer_name
ORDER BY total_sales DESC
LIMIT 5;
SELECT
    order_date,
    SUM(sales) AS daily_sales
FROM sales
GROUP BY order_date
ORDER BY order_date;
```

1. Query: Total number of records

Description:

This query is used to count the total number of records present in the sales table. It helps verify that the data has been successfully imported into the database.

2. Query: Total sales and total profit

Description:

This query calculates the overall total sales and total profit from the sales table using aggregate functions. It provides a summary of the business performance.

3. Query: Sales by category

Description:

This query calculates the total sales for each product category. It helps analyze which category contributes the most to overall sales.

4. Query: Profit by category

Description:

This query calculates the total profit generated by each product category. It helps identify the most profitable category.

5. Query: Top 5 customers by sales

Description:

This query identifies the top five customers based on their total sales amount. It is useful for understanding key customers who generate the highest revenue.

6. Query: Daily sales analysis

Description:

This query calculates total sales for each order date. It helps analyze daily sales trends over time.

RESULTS :

Query 1

```
1 • SELECT COUNT(*) FROM sales;  
2 • SELECT  
3     SUM(sales) AS total_sales,  
4     SUM(profit) AS total_profit  
5 FROM sales;  
6 • SELECT  
7     category,
```

Result 16 Result 17 Result 18 Result 19 Result 20 Result 21 x Read Only

The SQL queries successfully generated insights from the dataset. The analysis showed total sales and profit, category-wise performance, top customers, and daily sales trends. These results demonstrate the effective use of SQL for data analysis.
